

### CS 412 Intro. to Data Mining

Chapter 8. Classification: Basic Concepts

Jiawei Han, Computer Science, Univ. Illinois at Urbana-Champaign, 2017

### Chapter 8. Classification: Basic Concepts

- Decision Tree Induction
- Bayes Classification Methods
- Linear Classifier
- Model Evaluation and Selection
- ☐ Techniques to Improve Classification Accuracy: Ensemble Methods
- Additional Concepts on Classification
- Summary

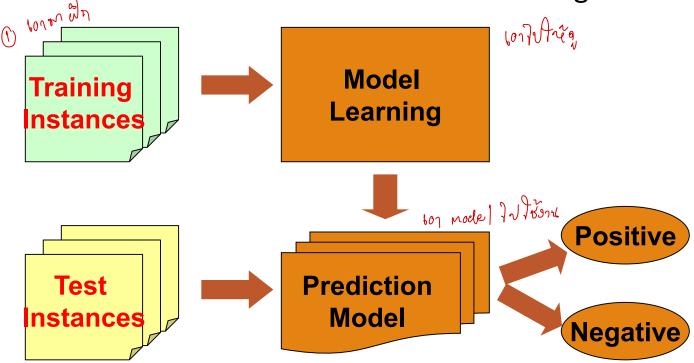

# Supervised vs. Unsupervised Learning (1)

- Supervised learning (classification)
- JX X Jamon
- Supervision: The training data such as observations or measurements are accompanied by labels indicating the classes which they belong to
- New data is classified based on the models built from the training set

#### Training Data with class label:

age	income	student	credit_rating	buys_computer
<=30	high	no	fair	no
<=30	high	no	excellent	no
3140	high	no	fair	yes
>40	medium	no	fair	yes
>40	low	yes	fair	yes
>40	low	yes	excellent	no
3140	low	yes	excellent	yes
<=30	medium	no	fair	no
<=30	low	yes	fair	yes
>40	medium	yes	fair	yes
<=30	medium	yes	excellent	yes
3140	medium	no	excellent	yes
3140	high	yes	fair	yes
>40	medium	no	excellent	no

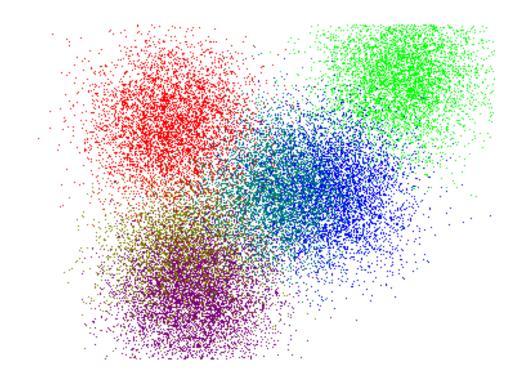

### Supervised vs. Unsupervised Learning (2)

Unsupervised learning (clustering)

- ชั่ X อญ่างเดียงโม่มีตาดาง (พีเจอร์ แม่งกลุ่ม เพลื่อนกับ 7 กลักัน ไม่เนมือน 7 กลกัน)
- The class labels of training data are unknown
- ☐ Given a set of observations or measurements, establish the possible existence

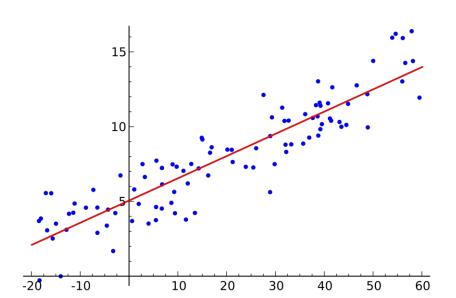

of classes or clusters in the data

## Prediction Problems: Classification vs. Numeric Prediction

- Classification ( mune on our nound
  - Predict categorical class labels (discrete or nominal)
  - Construct a model based on the training set and the class labels (the values in a classifying attribute) and use it in classifying new data
- Numeric prediction
  - Model continuous-valued functions (i.e., predict unknown or missing values)
- Typical applications of classification
  - Credit/loan approval
  - Medical diagnosis: if a tumor is cancerous or benign
  - ☐ Fraud detection: if a transaction is fraudulent
  - Web page categorization: which category it is

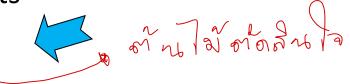

#### Classification—Model Construction, Validation and Testing

- □ Model construction ธุราวโฆษตล ⊃ รักพลุดพย ตั้งของ → ผ่าง → มาไปใช้อาน
  - □ Each sample is assumed to belong to a predefined class (shown by the **class label**)
  - ☐ The set of samples used for model construction is **training set**
  - Model: Represented as decision trees, rules, mathematical formulas, or other forms
- Model Validation and Testing:
  - Test: Estimate accuracy of the model
    - The known label of test sample is compared with the classified result from the model
    - ☐ Accuracy: % of test set samples that are correctly classified by the model
    - Test set is independent of training set
  - Validation: If the test set is used to select or refine models, it is called validation (or development) (test) set
- **Model Deployment:** If the accuracy is acceptable, use the model to classify new data

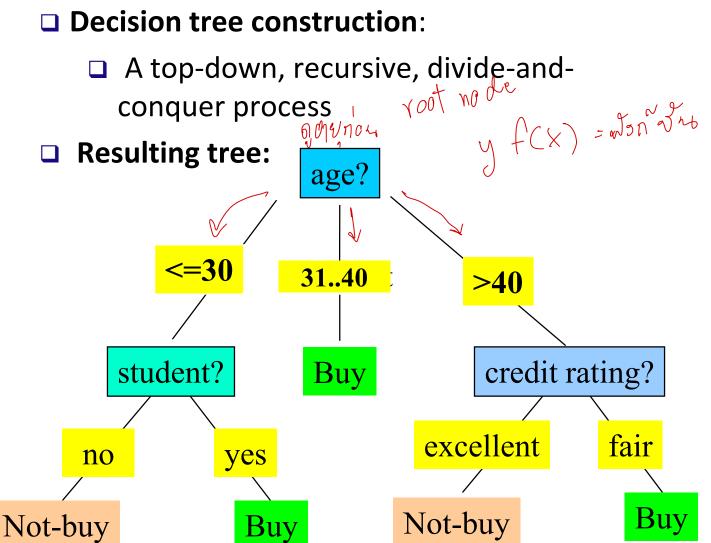

### Chapter 8. Classification: Basic Concepts

- Classification: Basic Concepts
- Decision Tree Induction

- Bayes Classification Methods
- Linear Classifier
- Model Evaluation and Selection
- ☐ Techniques to Improve Classification Accuracy: Ensemble Methods
- Additional Concepts on Classification
- Summary

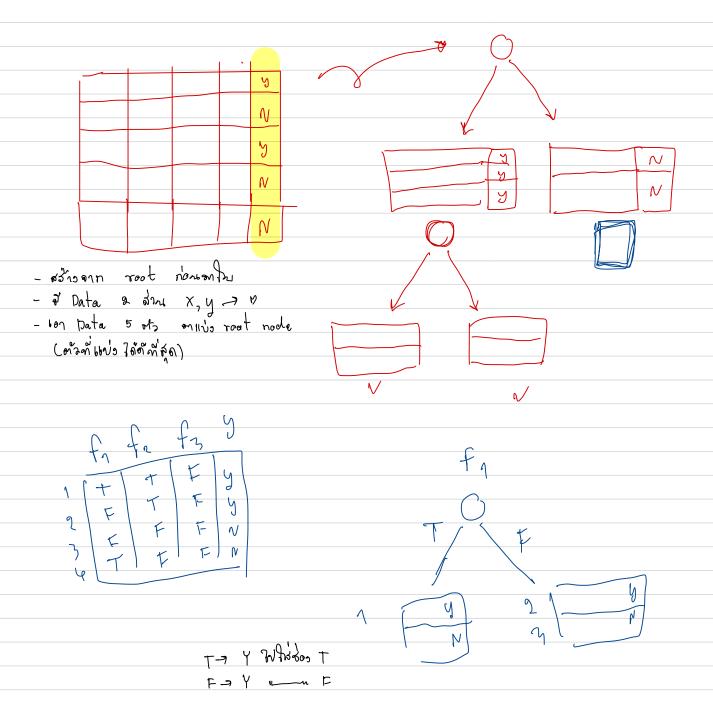

### **Decision Tree Induction: An Example**

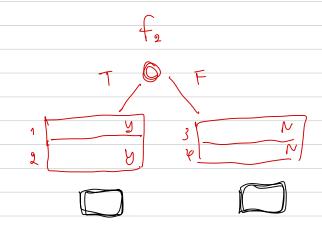

Training data set: Who buys computer?

	Training data set. Who bays compater:					
age	income	student	credit_rating	buys_computer		
<=30	high	no	fair	no		
<=30	high	no	excellent	/ no		
3140	high	no	fair	yes		
>40	medium	no	fair (	yes		
>40	low	yes	fair	yes		
>40	low	yes	excellent	no		
3140	low	yes	excellent	yes		
<=30	medium	no	fair	no		
<=30	low	yes	fair	yes		
>40	medium	yes	fair	yes		
<=30	medium	yes	excellent	/ yes		
3140	medium	no	excellent	yes		
3140	high	yes	fair	yes		
>40	medium	no	excellent	<sup>J</sup> no		

Note: The data set is adapted from Playing Tennis" example of R. Quinlan

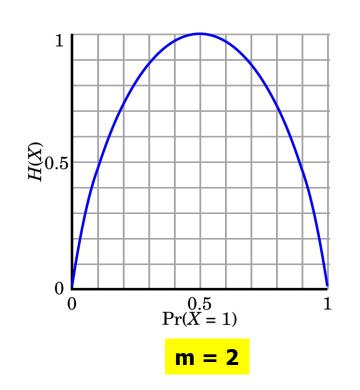

#### From Entropy to Info Gain: A Brief Review of Entropy

- Entropy (Information Theory)
  - A measure of uncertainty associated with a random number
  - $\Box$  Calculation: For a discrete random variable Y taking m distinct values  $\{y_1, y_2, ..., y_m\}$

$$H(Y) = -\sum_{i=1}^{m} p_i \log(p_i) \quad where \ p_i = P(Y = y_i)$$

- Interpretation
  - ☐ Higher entropy → higher uncertainty
  - Lower entropy → lower uncertainty
- Conditional entropy

$$H(Y|X) = \sum_{x} p(x)H(Y|X = x)$$

### Information Gain: An Attribute Selection Measure

- □ Select the attribute with the highest information gain (used in typical decision tree induction algorithm: ID3/C4.5)
- Let  $p_i$  be the probability that an arbitrary tuple in D belongs to class  $C_i$ , estimated by  $|C_{i,D}|/|D|$
- Expected information (entropy) needed to classify a tuple in D:

$$Info(D) = -\sum_{i=1}^{m} p_i \log_2(p_i) \qquad 1 \text{ as}$$

□ Information needed (after using A to split D into v partitions) to classify D:

$$Info_A(D) = \sum_{j=1}^v \frac{|D_j|}{|D|} \times Info(D_j)$$
 has he and a nason of the second states of

Information gained by branching on attribute A

$$Gain(A) = Info(D) - Info_A(D)$$

#### **Example: Attribute Selection with Information Gain**

- Class P: buys\_computer = "yes"
- ☐ Class N: buys\_computer = "no" N

$$Info(D) = I(9,5) = \frac{9}{14} \log_2(\frac{9}{14}) + \frac{5}{14} \log_2(\frac{5}{14}) = 0.940$$

age	p <sub>i</sub>	n <sub>i</sub>	I(p <sub>i</sub> , n <sub>i</sub> )
<=30	2	3	0.971
3140	4	0	0
>40	3	2	0.971

age	income	student	credit_rating	buys_computer
<=30	high	no	fair	/ no j
<=30	high	no	excellent	/ no
3140	high	no	fair	/ yes
>40	medium	no	fair	/ yes
>40	low	yes	fair	yes
>40	low	yes	excellent	no
3140	low	yes	excellent	yes
<=30	medium	no	fair	no
<=30	low	yes	fair	yes
>40	medium	yes	fair	yes
<=30	medium	yes	excellent	yes
3140	medium	no	excellent	yes /
3140	high	yes	fair	yes
>40	medium	no	excellent	no

$$Info_{age}(D) = \frac{5}{14}I(2,3) + \frac{4}{14}I(4,0) + \frac{5}{14}I(3,2) = 0.694$$

 $\frac{5}{14}I(2,3)$  means "age <=30" has 5 out of 14 samples, with 2 yes'es and 3 no's.

Hence 
$$Gain(age) = Info(D) - Info_{age}(D) = 0.246$$
 Similarly, we can get

$$Gain(income) = 0.029$$

$$Gain(student) = 0.151$$

$$Gain(credit\ rating) = 0.048$$
